Positive (P)

Negative (N)

Semi-supervised

Positive

Negative

Unlabeled (U)

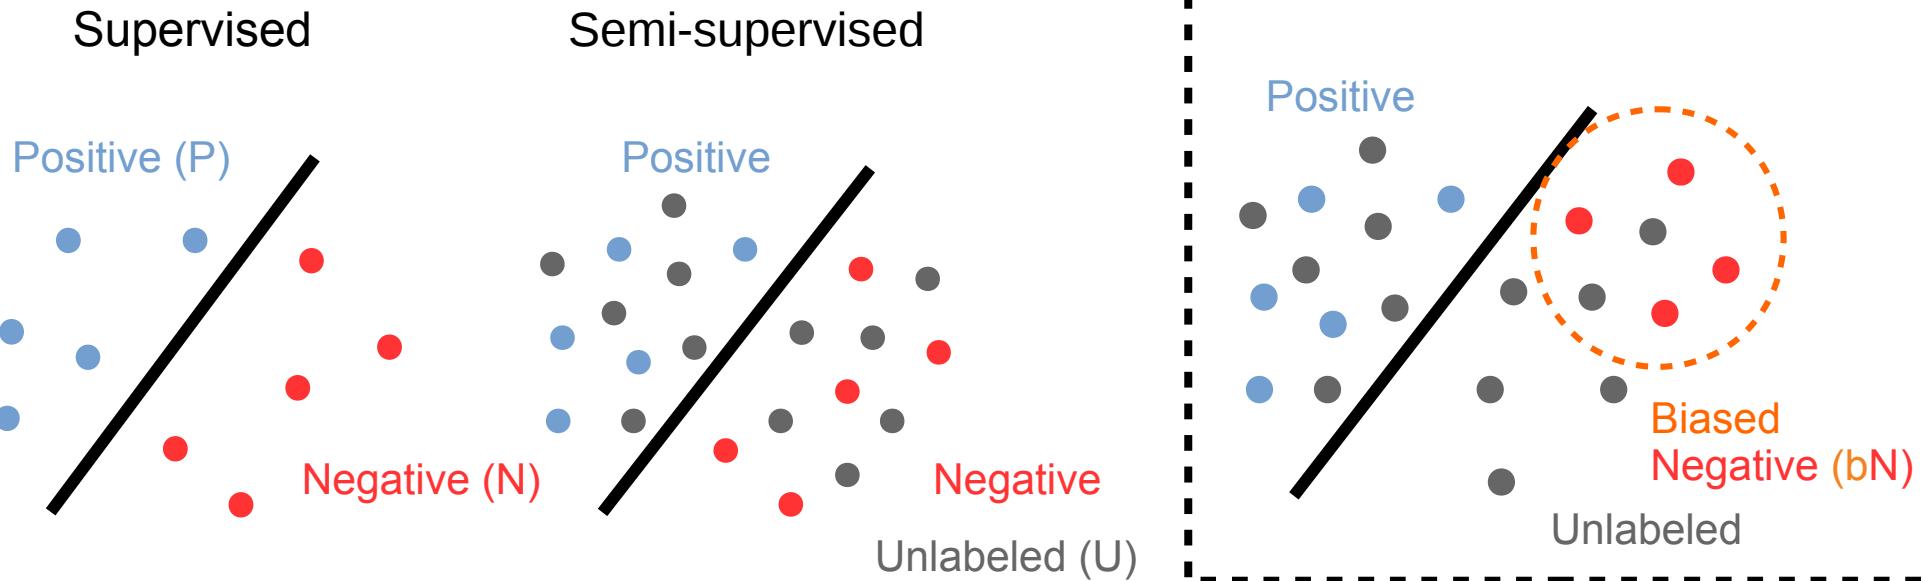

PUbN

Positive

Biased Negative (bN)

Unlabeled

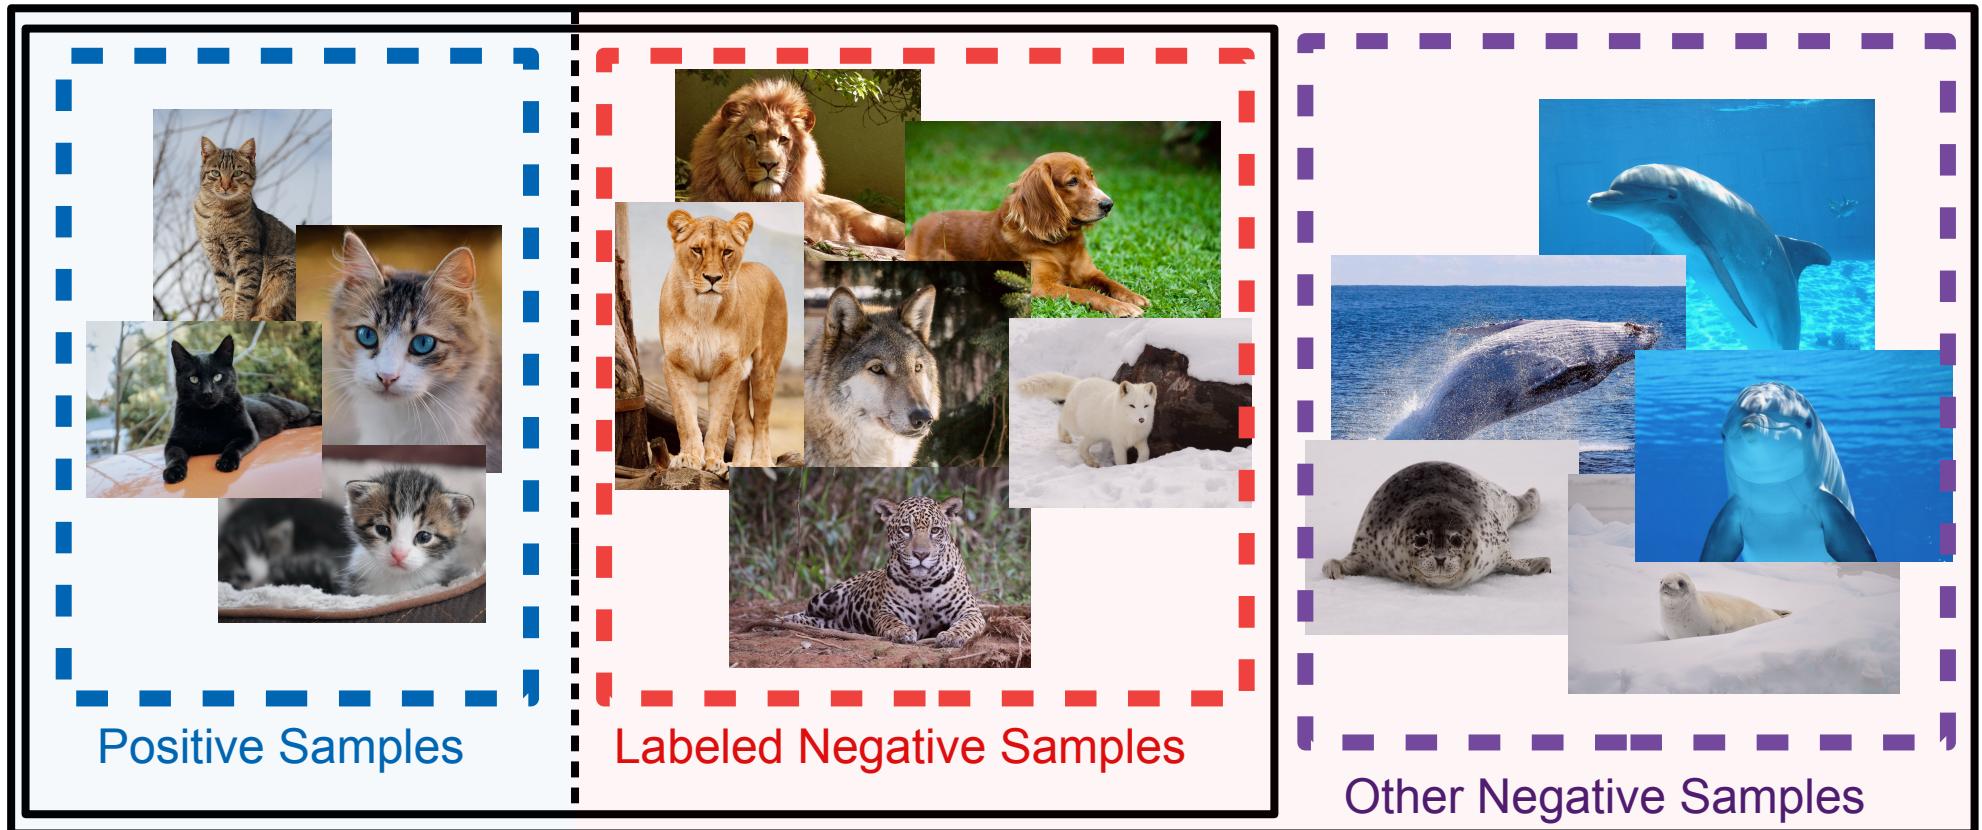

Background and problem setup

- $\sim p_P(x) := p(x \mid y = +1)$
- $\sim p_N(x) := p(x \mid y = -1)$

- $\sim p(x)$
- $\sim p_{bN}(x) := p(x \mid y = -1, s = +1)$

Motivating examples

- Information retrieval, text classification, sentiment analysis
- Medical diagnosis: healthy population requesting physical exams is biased

Method: Empirical risk estimator

$$\min_{g \in \mathcal{G}} \underbrace{\mathbb{E}_{(x,y) \sim p(x,y)} [\ell(yg(x))]}_{R(g)}$$

Risk Minimization

←
Unbiased
Estimator

$$\min_{g \in \mathcal{G}} \frac{1}{n} \sum_{i=1}^n \ell(y_i g(x_i))$$

$\hat{R}(g)$

Unbiased labeled data
Empirical Risk Minimization

Method: Empirical risk estimator

$$\begin{aligned} R(g) = & \pi \mathbb{E}_{x \sim p_{\mathcal{P}}(x)} [\ell(g(x))] + \pi \mathbb{E}_{x \sim p_{\mathcal{P}}(x)} \left[1_{\sigma(x) > \eta} \ell(-g(x)) \frac{1 - \sigma(x)}{\sigma(x)} \right] \\ & + \rho \mathbb{E}_{x \sim p_{\text{bN}}(x)} [\ell(-g(x))] + \rho \mathbb{E}_{x \sim p_{\text{bN}}} \left[1_{\sigma(x) > \eta} \ell(-g(x)) \frac{1 - \sigma(x)}{\sigma(x)} \right] \\ & + \mathbb{E}_{x \sim p(x)} [1_{\sigma(x) \leq \eta} \ell(-g(x))(1 - \sigma(x))] \end{aligned}$$

$\sigma(x) = p(s=+1|x)$ probability of x being labeled

$\eta > 0$ determining how we rely on the U data to approximate the risk

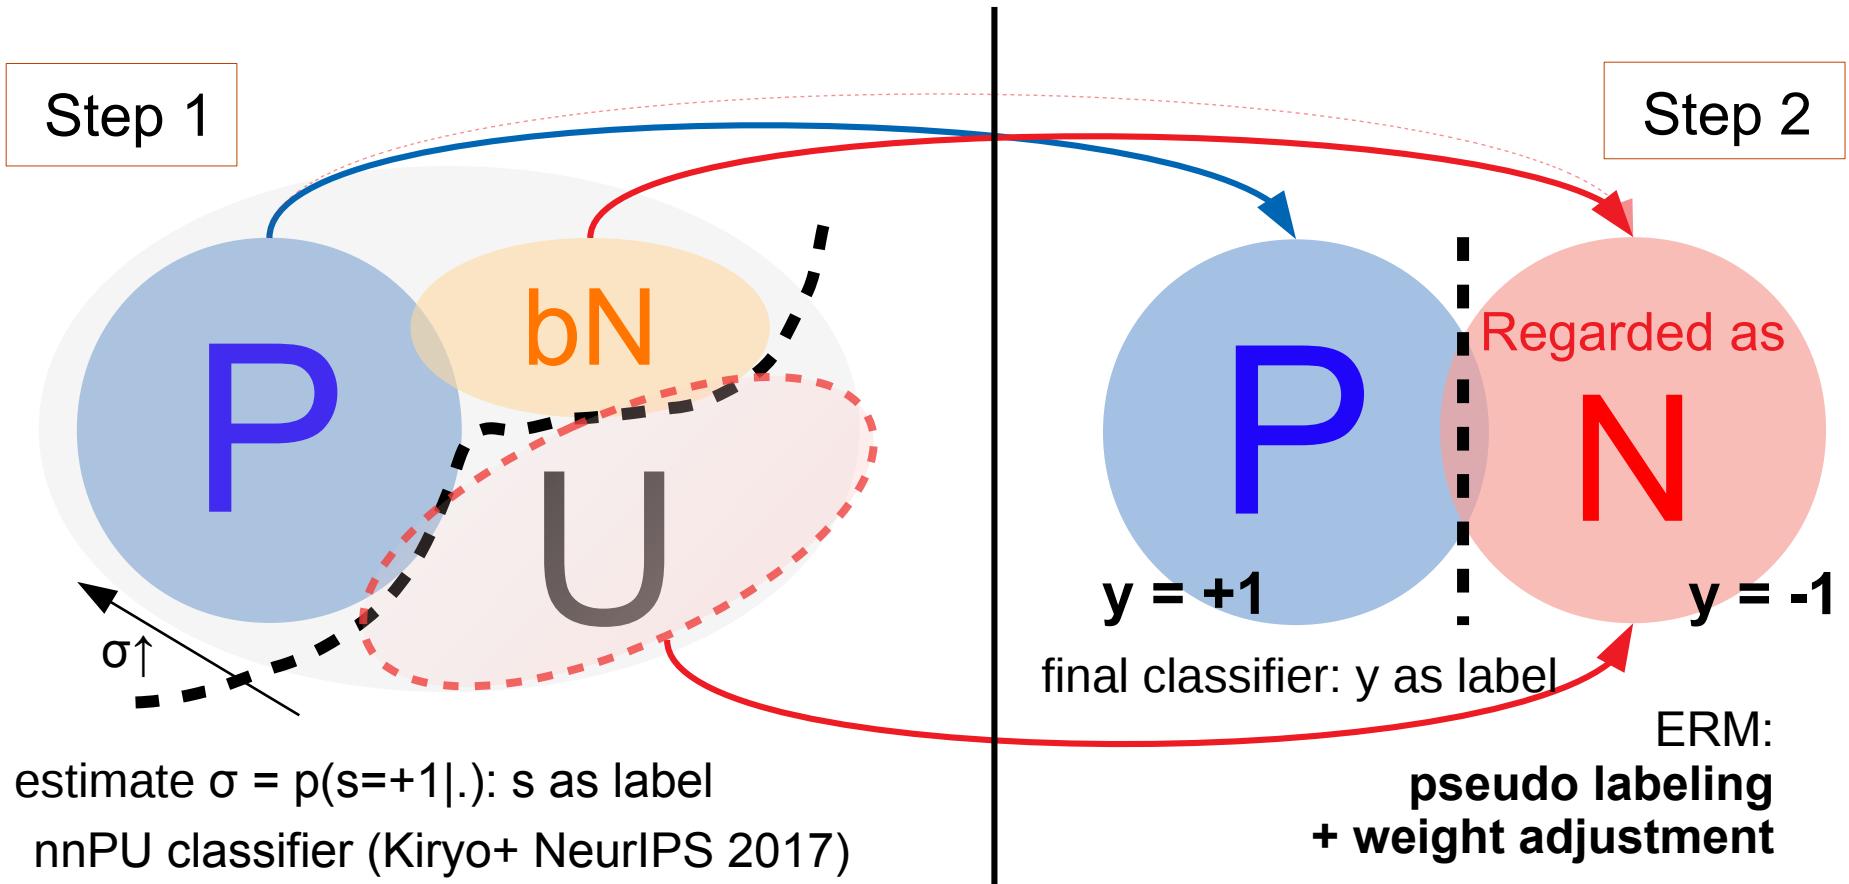

Method: Empirical risk estimator

$$R(g) = \boxed{\pi \mathbb{E}_{x \sim p_{\text{P}}(x)} [\ell(g(x))] + \pi \mathbb{E}_{x \sim p_{\text{P}}(x)} \left[1_{\sigma(x) > \eta} \ell(-g(x)) \frac{1 - \sigma(x)}{\sigma(x)} \right]} \quad \#\text{P data}$$
$$+ \boxed{\rho \mathbb{E}_{x \sim p_{\text{bN}}(x)} [\ell(-g(x))] + \rho \mathbb{E}_{x \sim p_{\text{bN}}} \left[1_{\sigma(x) > \eta} \ell(-g(x)) \frac{1 - \sigma(x)}{\sigma(x)} \right]} \quad \#\text{bN data}$$
$$+ \boxed{\mathbb{E}_{x \sim p(x)} [1_{\sigma(x) \leq \eta} \ell(-g(x))(1 - \sigma(x))]} \quad \#\text{U data}$$

$\sigma(x) = p(s=+1|x)$ probability of x being labeled

$\eta > 0$ determining how we rely on the U data to approximate the risk

Method: Illustration

Estimation error bound

With probability at least $1-\delta$

$$R(\hat{g}) - R(g^*) \leq \frac{4\pi L_\ell}{\eta} \mathfrak{R}_{n_P, p_P}(\mathcal{G}) + \frac{2\pi C_\ell}{\eta} \sqrt{\frac{\ln(6/\delta)}{2n_P}} + \frac{4\rho L_\ell}{\eta} \mathfrak{R}_{n_{bN}, p_{bN}}(\mathcal{G}) + \frac{2\rho C_\ell}{\eta} \sqrt{\frac{\ln(6/\delta)}{2n_{bN}}} \\ \text{\#P data} \quad \quad \quad \text{\#bN data} \\ + 4L_\ell \mathfrak{R}_{n_U, p}(\mathcal{G}) + 2C_\ell \sqrt{\frac{\ln(6/\delta)}{2n_U}} + 2C_\ell \sqrt{\zeta\epsilon} + \frac{2C_\ell}{\eta} \sqrt{(1-\zeta)\epsilon} \\ \text{\#U data} \quad \quad \quad \text{Bias due to inexact approximation of } \sigma$$

Experiments

Models: ConvNet / ResNet / FCN + Training: Amsgrad
